

Sunflower

Helianthus annuus

Generated: 02-Dec-2025

The Sunflower is a tall, annual plant recognized for its large, bright yellow blooms and heliotropic behavior, turning to face the sun. Belonging to the genus *Helianthus*, it is native to North America. Sunflowers have thick, rough stems, broad leaves, and composite flowers consisting of numerous small florets forming a central disc surrounded by petal-like ray florets. They are cultivated for ornamental purposes, seeds, and oil production. Sunflowers thrive in full sunlight, fertile soil, and regular watering, symbolizing adoration, loyalty, and longevity in many cultures.
